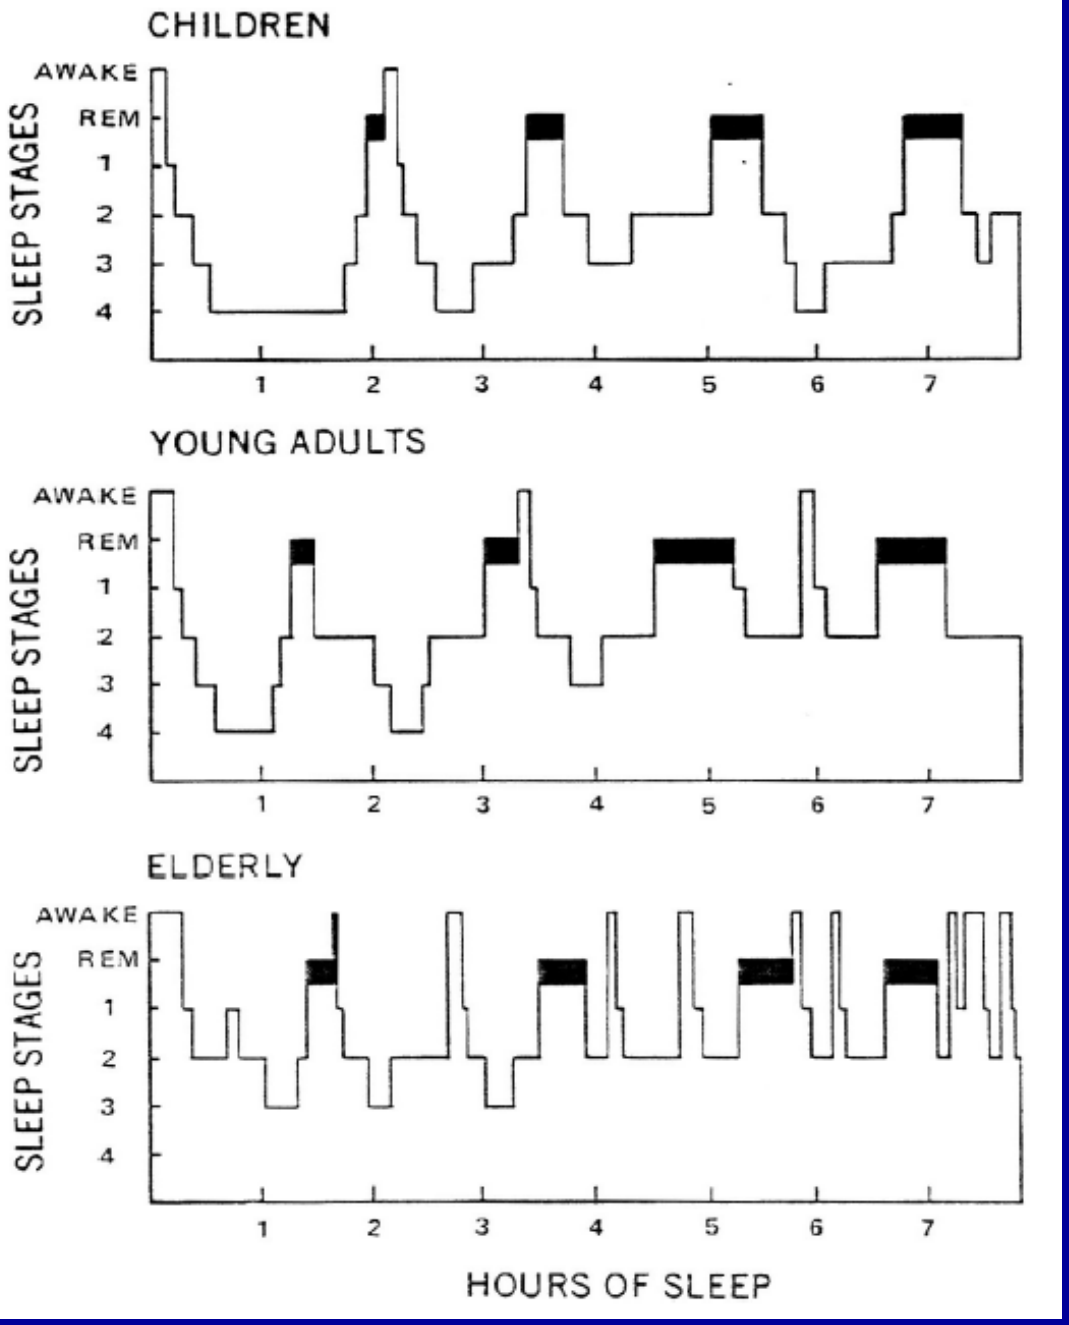
Why do we sleep?

Repair and Restoration Theory

- sleep enables the body and brain to repair after activity during the day – homeostatic balance
- memory
- Sleep deprivation leads to irritability, impaired concentration and hallucinations

- BUT, how much we sleep does not depend on how much we worked that day



C. R. Soldatos & T. J. Paparrigopoulos

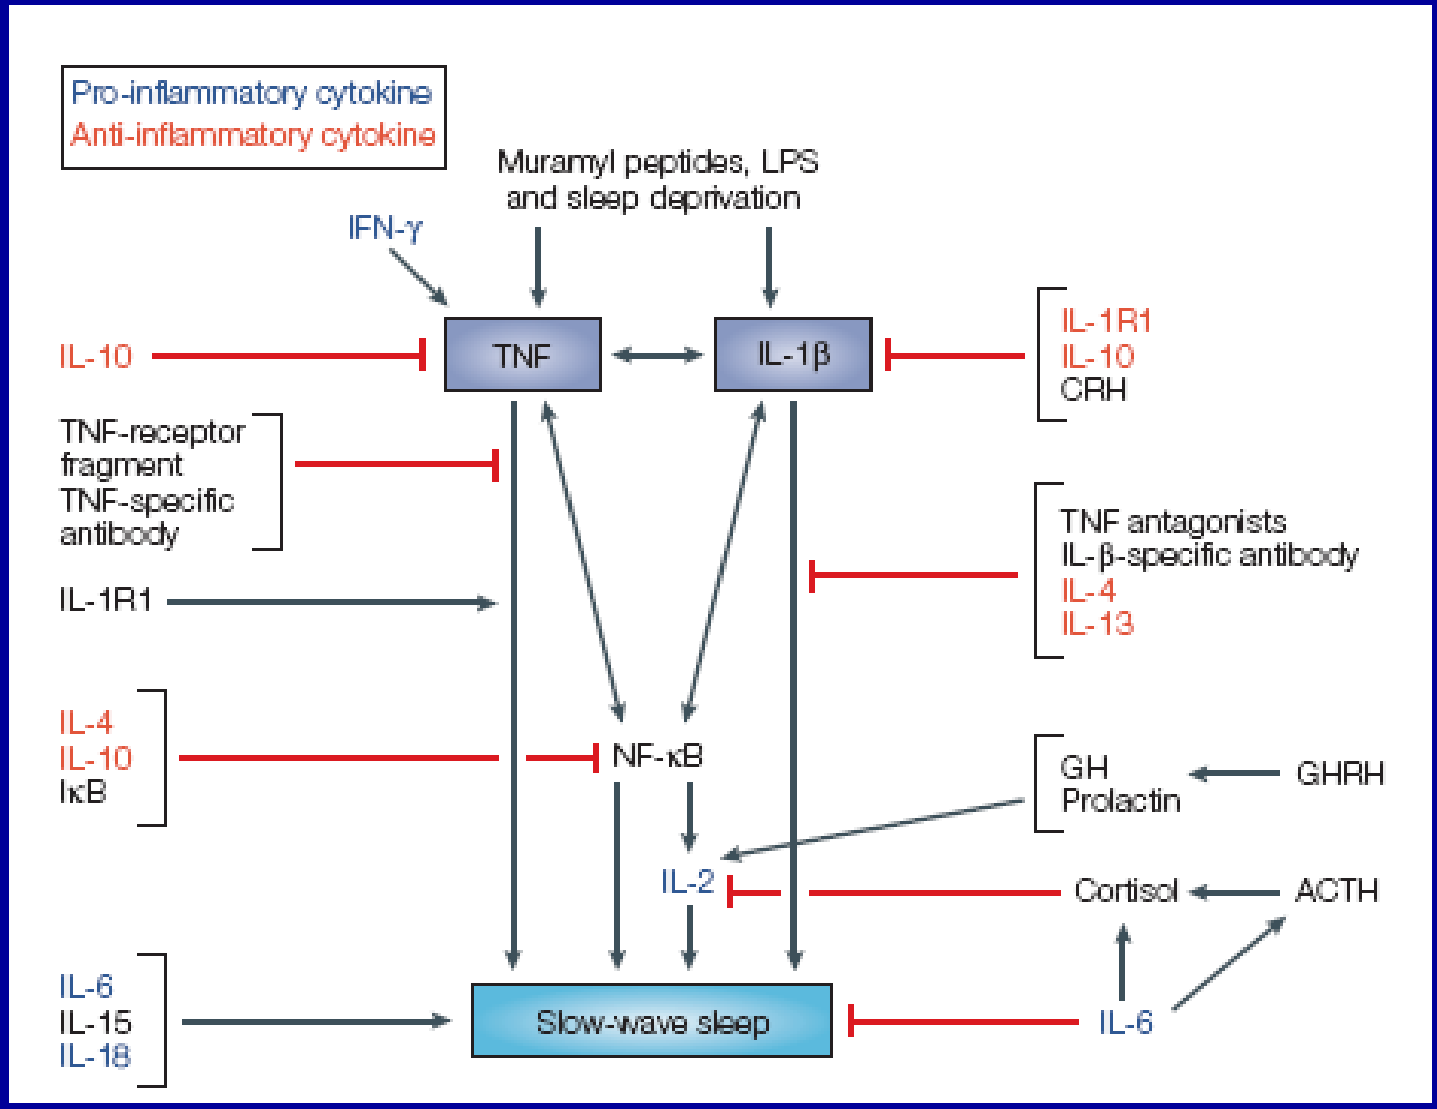
International Review of Psychiatry, August 2005; 17(4): 213–228

Consequences of Chronic Sleep Deprivation

Sleep is a vital and necessary function, and sleep needs (like hunger and thirst) must be met.

- 40-70 million Americans experience either chronic or intermittent sleep-related problems
- Untreated sleep disorders have a profound impact nationally in terms of reduced quality of life, lower productivity, increased morbidity and mortality, and decreased public safety
- Lack of awareness among health care professionals and the public

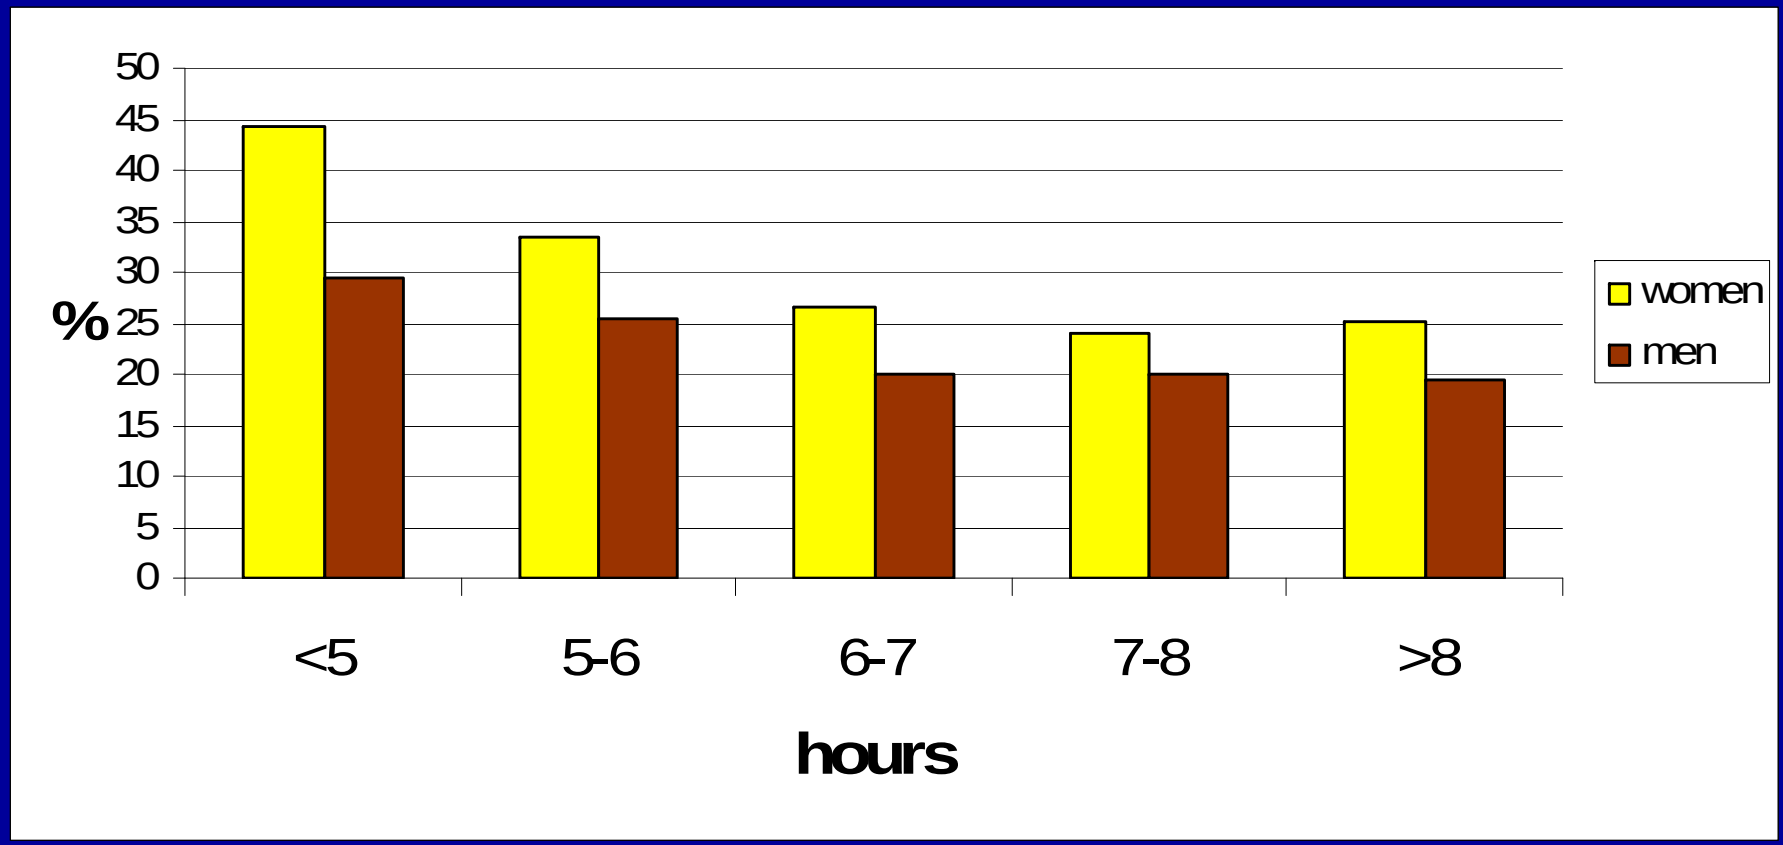
Cytokines and sleep



Sleep and the Cardiovascular System

- Sleep deprivation increases concentrations of cytokines and C-reactive protein
- This inflammation can lead to endothelial damage, leading to possible stroke or heart disease
- Blood pressure and heart rate are higher following sleep deprived nights (Voelker, 1999)
- Sleep deprivation increases risk of heart disease in women (Josefson, 2003)

SLEEP TIME AND HYPRTENSION



Sleep in CKD

Sleep disorders in CKD – why is it important?

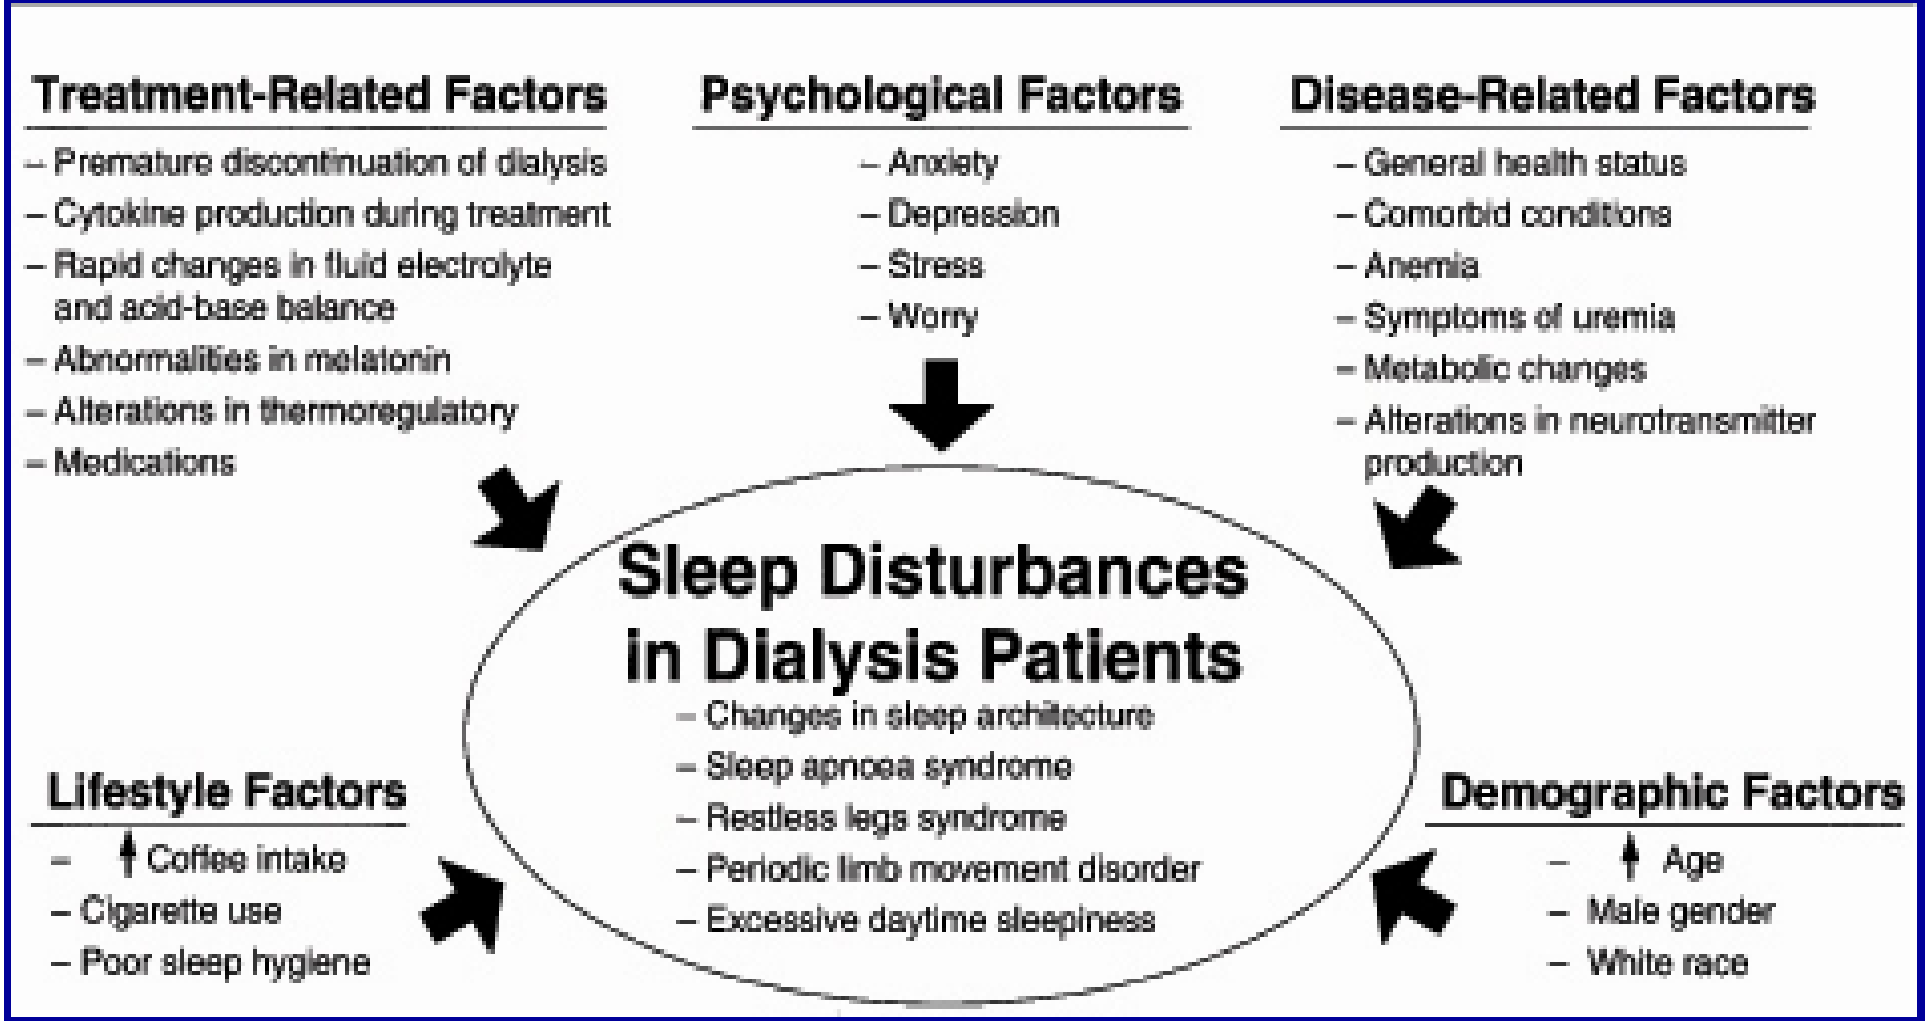
- Sleep problems are one of the most common complaints of patients in the dialysis unit
- Sleep Apnea Syndrome (SAS) may contribute to the pathogenesis of hypertension, CV morbidity
- Sleep disorders may impair quality of life
- Poor sleep is a predictor of morbidity and mortality in this patient population
- Sleep disorders are treatable – successful treatment may improve clinical outcomes

Sleep disorders in dialysis patients (30-80%)

- Insomnia
  - 4-29% vs 15-70%
- Sleep apnea syndrome (SAS)
  - 2-4% vs 20-70%
- Restless legs syndrome (RLS)
  - 5-15% vs 15-80%

Little is known about sleep problems in „predialysis" and transplanted patients

Factors contributing to sleep disturbances in patients on dialysis



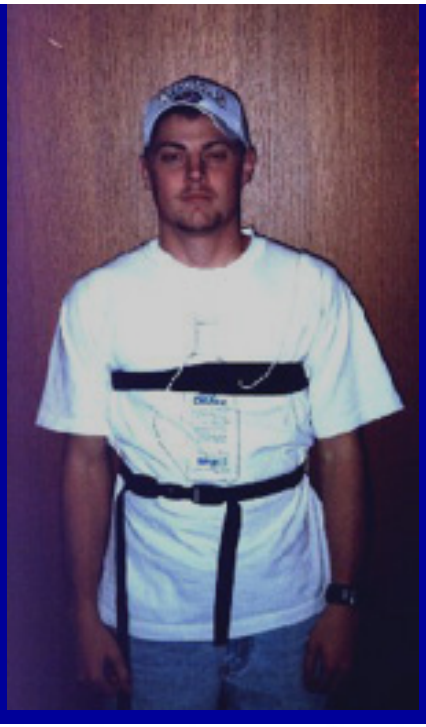
K. Parker., Sleep Medicine Reviews, Vol. 7, No. 2, pp 131-143, 2003

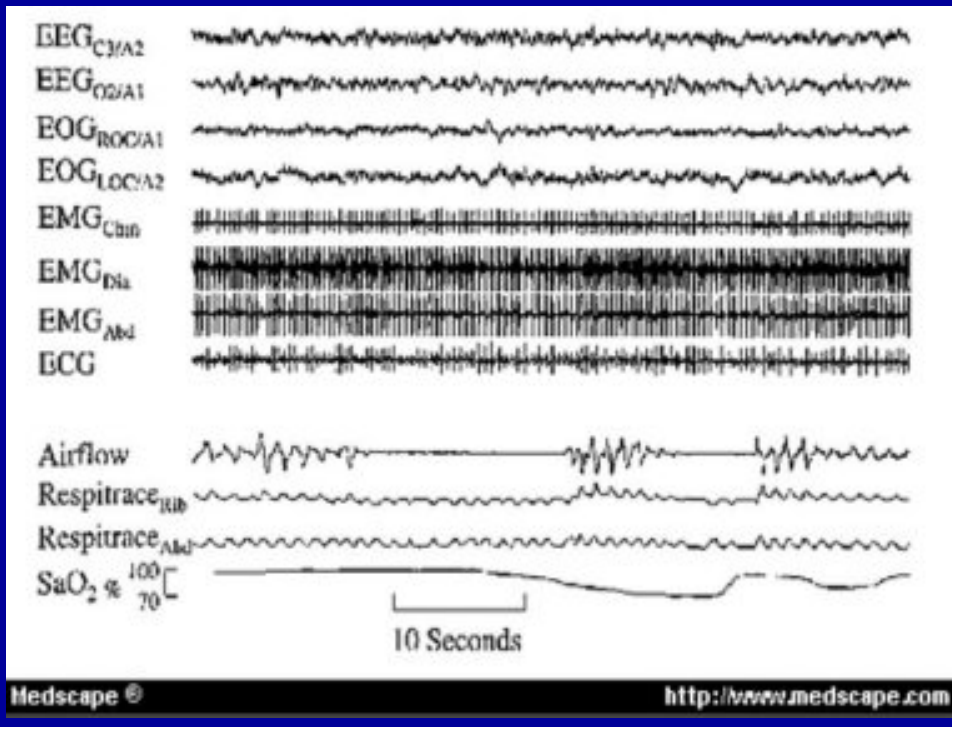
Diagnostic tools to detect sleep problems

- Sleep diaries
- Self administered questionnaires
  - Insomnia: Pittsburgh Sleep Quality Index, Athen Insomnia Scale
  - SAS: Berlin Questionnaire
  - RLS: Restless Legs Syndrome Questionnaire
  - Epworth Sleepiness Scale
- Clinical interview
- Actigraphy
- Polysomnography (SAS, PLMS)
  - MSLT, MWT – daytime effects

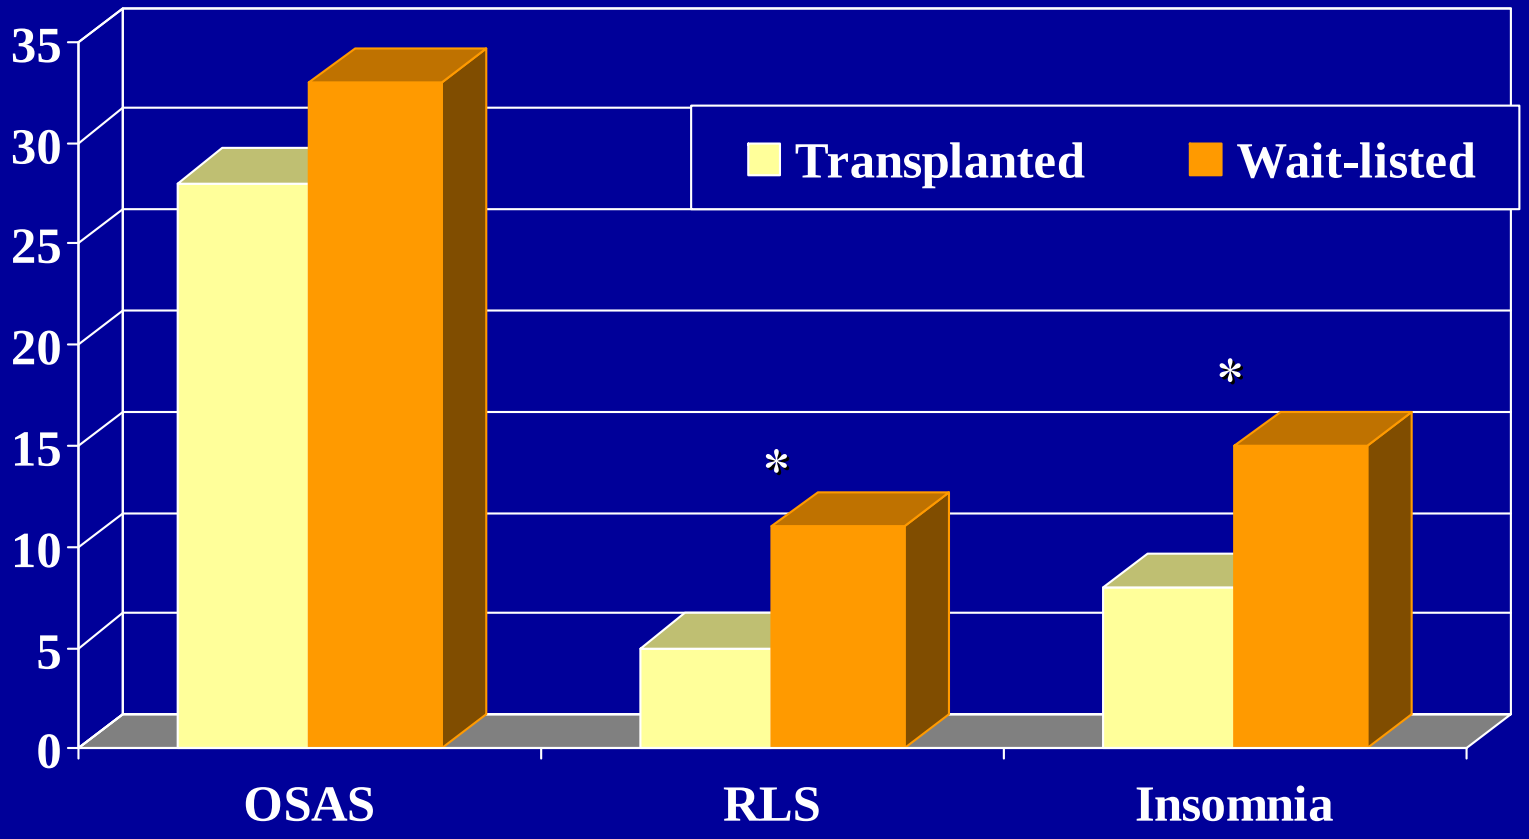
Polysomnography

- neurophysiologic variables (electrooculography, EEG, submental myogram) – sleep stages
- Measurment of resp. effort
- Art. O2 sat., pCO2 – transdermal pulsoxymetry
- ECG
- Limb movements



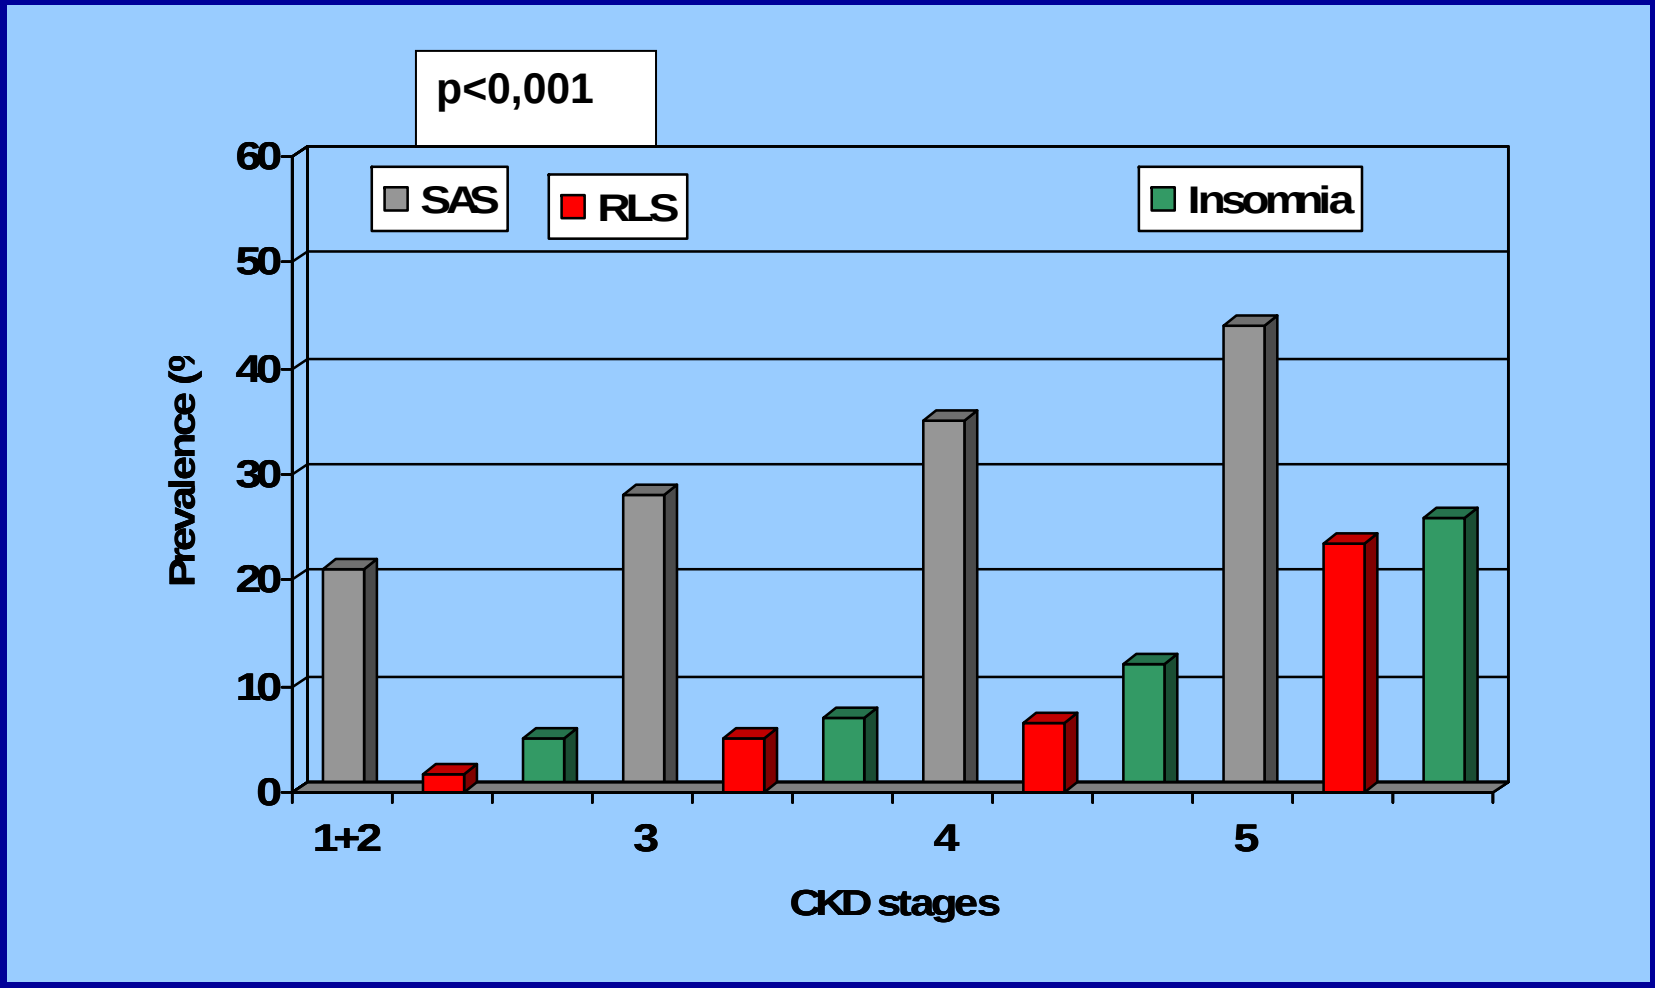


Prevalence of sleep disorders in Hungarian dialysis and transplanted patients



*: P<0.001, Khi-square test

Sleep problems and renal function in transplant patients (n=920)

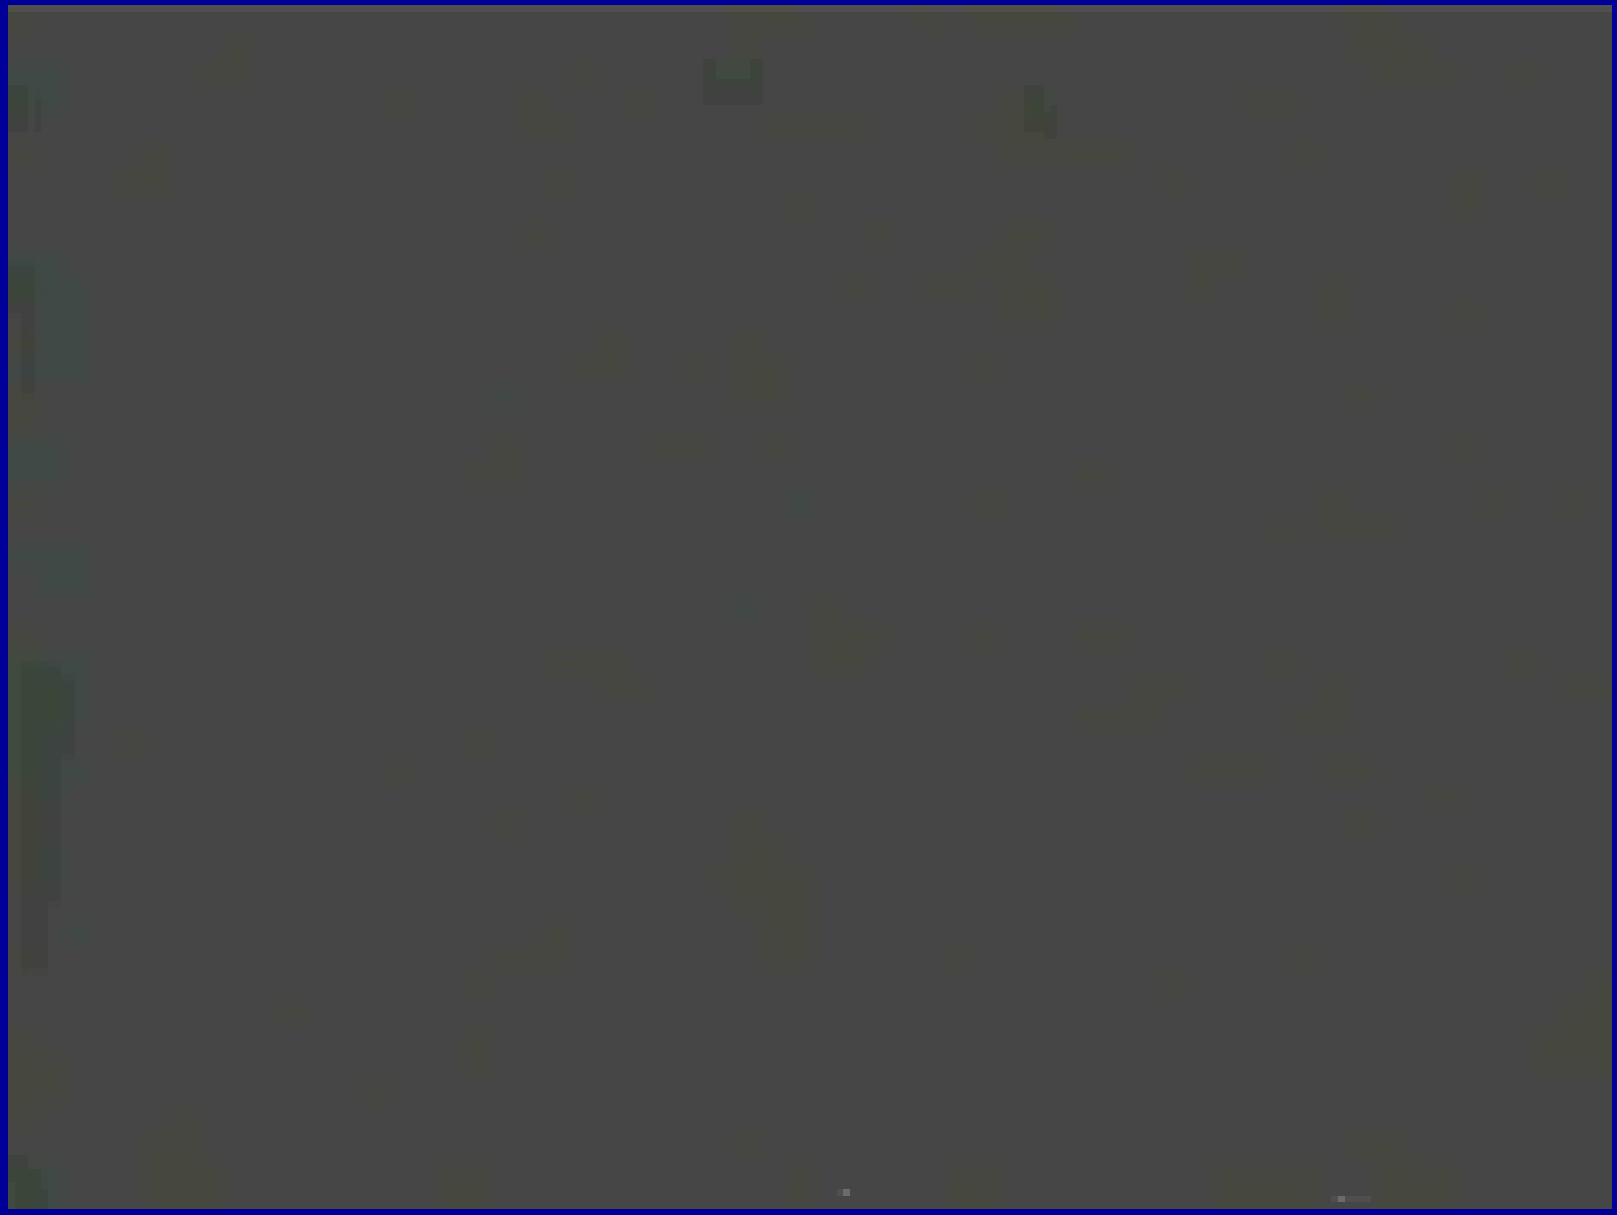


Restless legs syndrome

Restless legs syndrome (RLS)

- Restless legs syndrome (RLS) is characterized by an urge to move the legs that is often hard to resist and is usually but not always associated with disagreeable leg sensations
- Main symptoms:
  - 1. An urge to move the legs, usually accompanied or caused by uncomfortable and unpleasant sensations in the legs.
  - 2. The unpleasant sensations begin or worsen during rest or inactivity
  - 3. The unpleasant sensations are partially or totally relieved by movement
  - 4. The unpleasant sensations are worse in the evening or night than during the day or only occur in the evening or night

RLS



Restless Legs Syndrome

Predictors, etiology

- Altered CNS dopamin metabolism
- Iron deficiency (cerebral versus peripheral)
- Uremia – uremic toxins?
- Anemia
- Neuropathy

Consequences

- Fragmented sleep, „intitiation” insomnia
- Fatigue, tiredness
- Daytime sleepiness
- Impaired QoL
- Incr. mortality?

- Prevalence of RLS: 12-20% in dialysed[1,2] and 4.5% in kidney transplanted populations[3]
- RLS is associated with increased risk of
- insomnia and impaired quality of life (QoL) in dialysed patients[4]
- There is no data regarding the association of RLS, poor sleep and QoL after renal transplantation

Multivariate Cox-modell

	Mortality		
	HR	**95% CI**	**p**
Presence of RLS	**2**	**1.03-3.95**	**0.04**

Adjusted for: age, gender, eGFR, albumin, hemoglobin, CRP, diabetes, hypertonia and transplant vintage

American Journal of Kidney Diseases, Vol 50, No 5 (November), 2007: pp 813-820

Clinical management of RLS in CKD

- Adequate dialysis/ renal transplantation
- Iv iron/ anemia management (Dose?)
- Drugs
  - Ropirinole, pramipexole, carbidopa/levodopa,
  - Benzodiazepines - efficacy??
  - Gabapentin, carbamazepine – efficacy??

OSAS

Sleep apnea syndrome

- intermittent episodes of breathing cessation during sleep,
  - airway collapse (obstructive sleep apnoea, OSA)
  - cessation of respiratory effort (central SA)
  - or both (mixed SA)
- The severity of the SAS is usually characterized by the number of apneic events per hour of sleep (AHI, RDI) (RDI>5 is considered pathological), severity of desaturation and by the presence and severity of daytime sleepiness.
- SAS is associated with disturbances of sleep initiation and maintenance as well as daytime sleepiness.
- A potential link is suggested between SAS and HTN, CAD, CHF and arrhytmias

OSAS

- Upper airway obstruction
- Anatomical problems
- Decreased muscle tone ↓
  +
  weakness of pharyngeal wall

} Dynamic collapse during inspiration

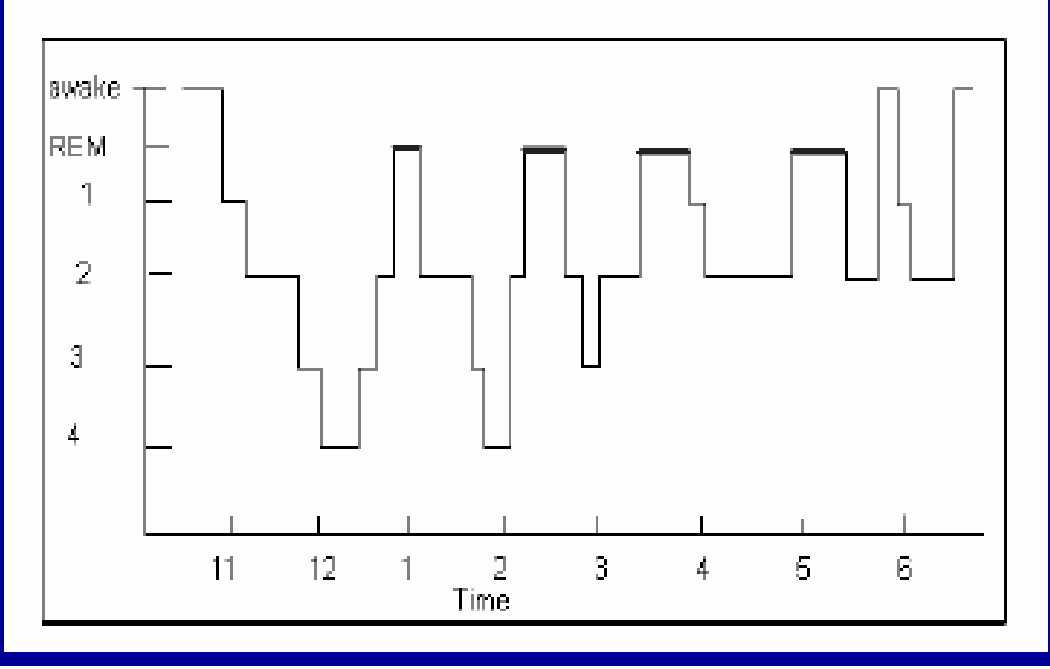
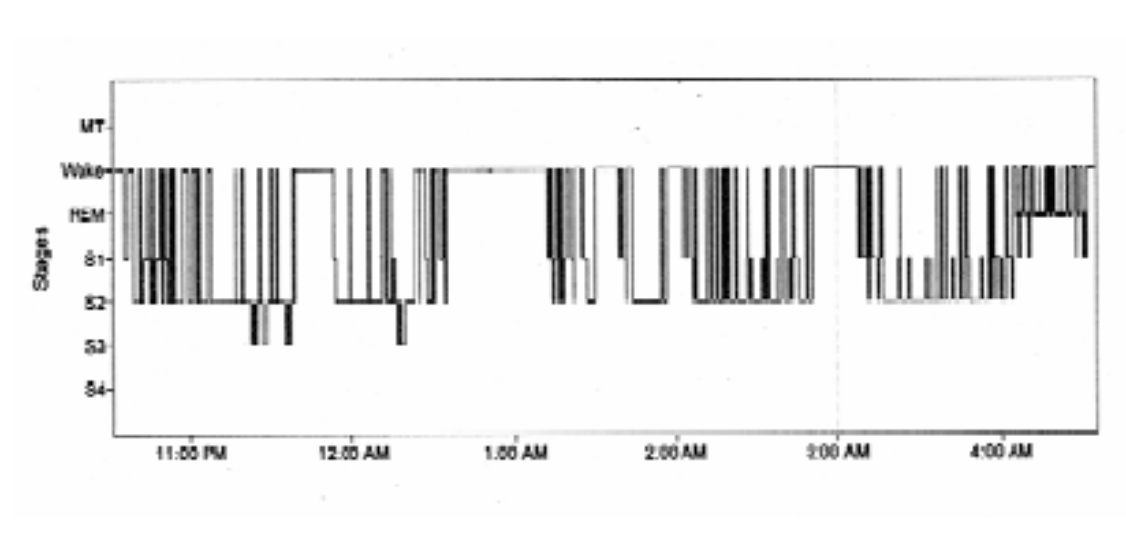
Apnea leads to micro-arousals and fragmented sleep





Sleep Apnoe Syndrome

Predictors, correlates

- Age
- Obesitas (BMI, neck circumference)
- Male gender/menopause
- Alcohol
- Uremic toxins?
- Anemia
- Altered metabolic state

Consequences

- Daytime seleepiness
- Accidents
- Cognitive impairment
- Depression
- Sexual dysfunction
- Hypertension, LVH, CAD, arrhytmias
- Impaired QoL
- Increased morbidity, mortality?

CKD specific factors potentially contributing to the pathogenesis of SAS

- Hypocapnia, acid-base disorders
- Uremic toxins – effects on CNS
- Soft tissue edemea
- Anemia
- Endocrine problems (menopause – gender difference)
- Dialysis modality (HD-cytokines, type of PD)

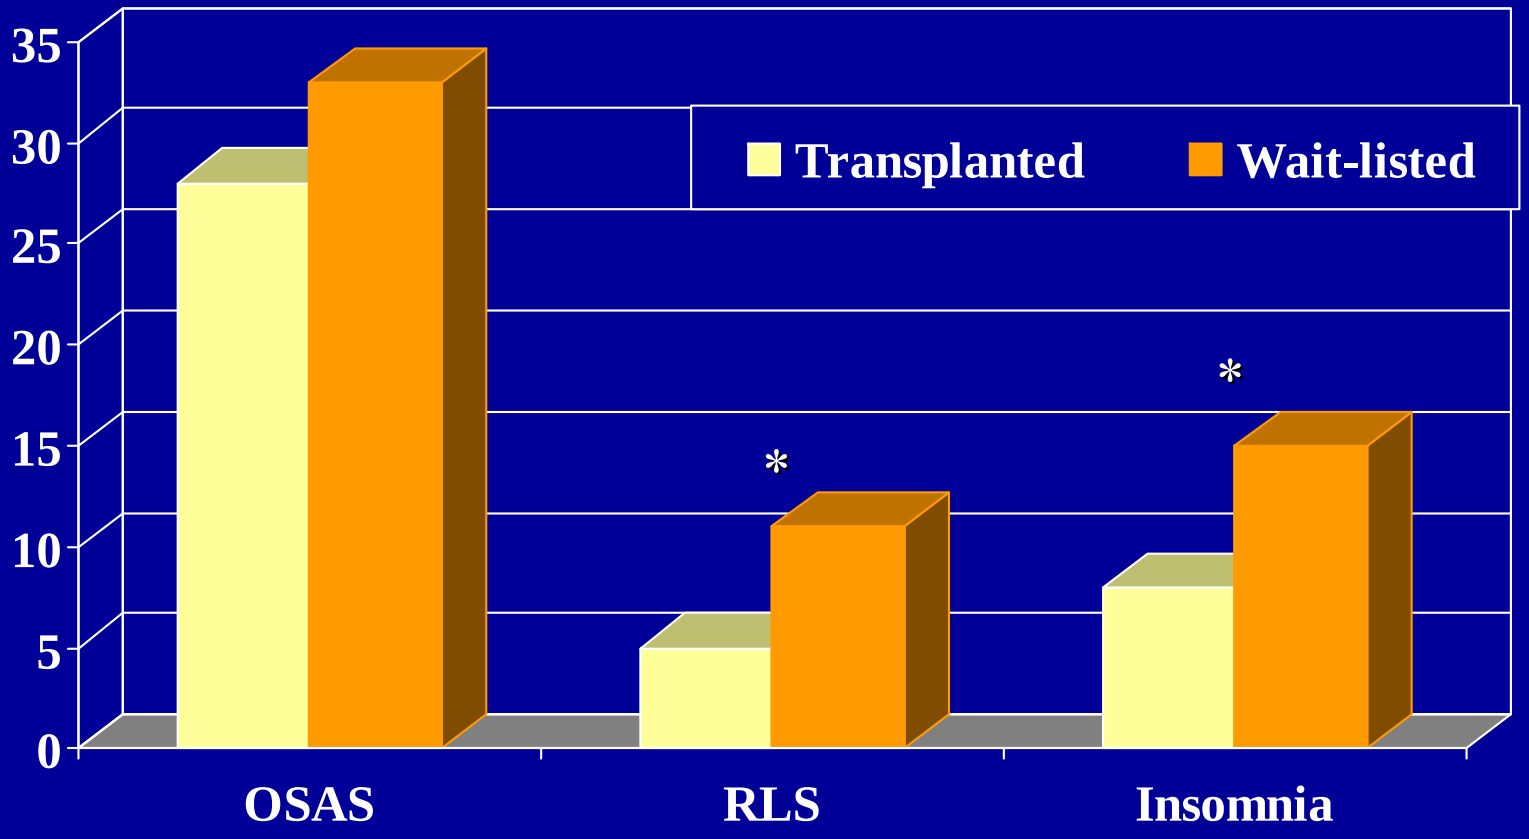
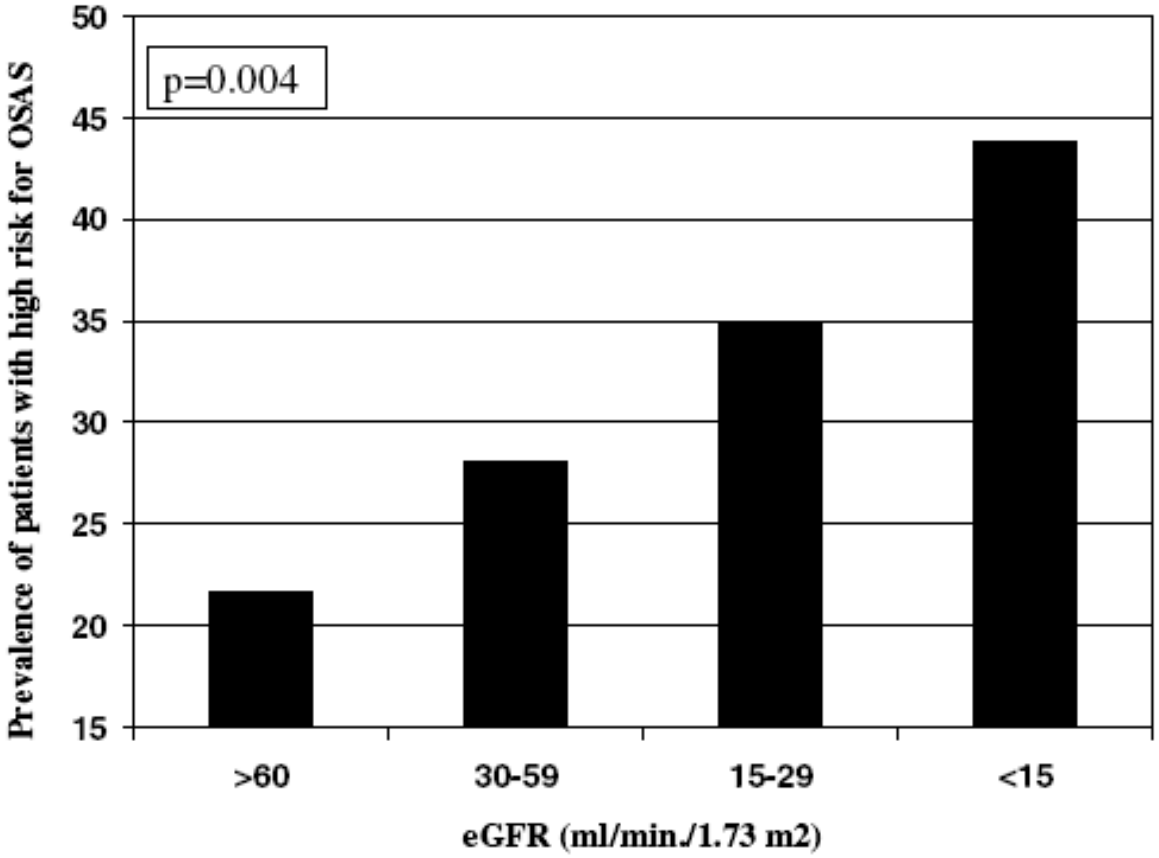
Prevalence of sleep disorders in Hungarian dialysis and transplanted patients



*: P<0.001, Khi-square test

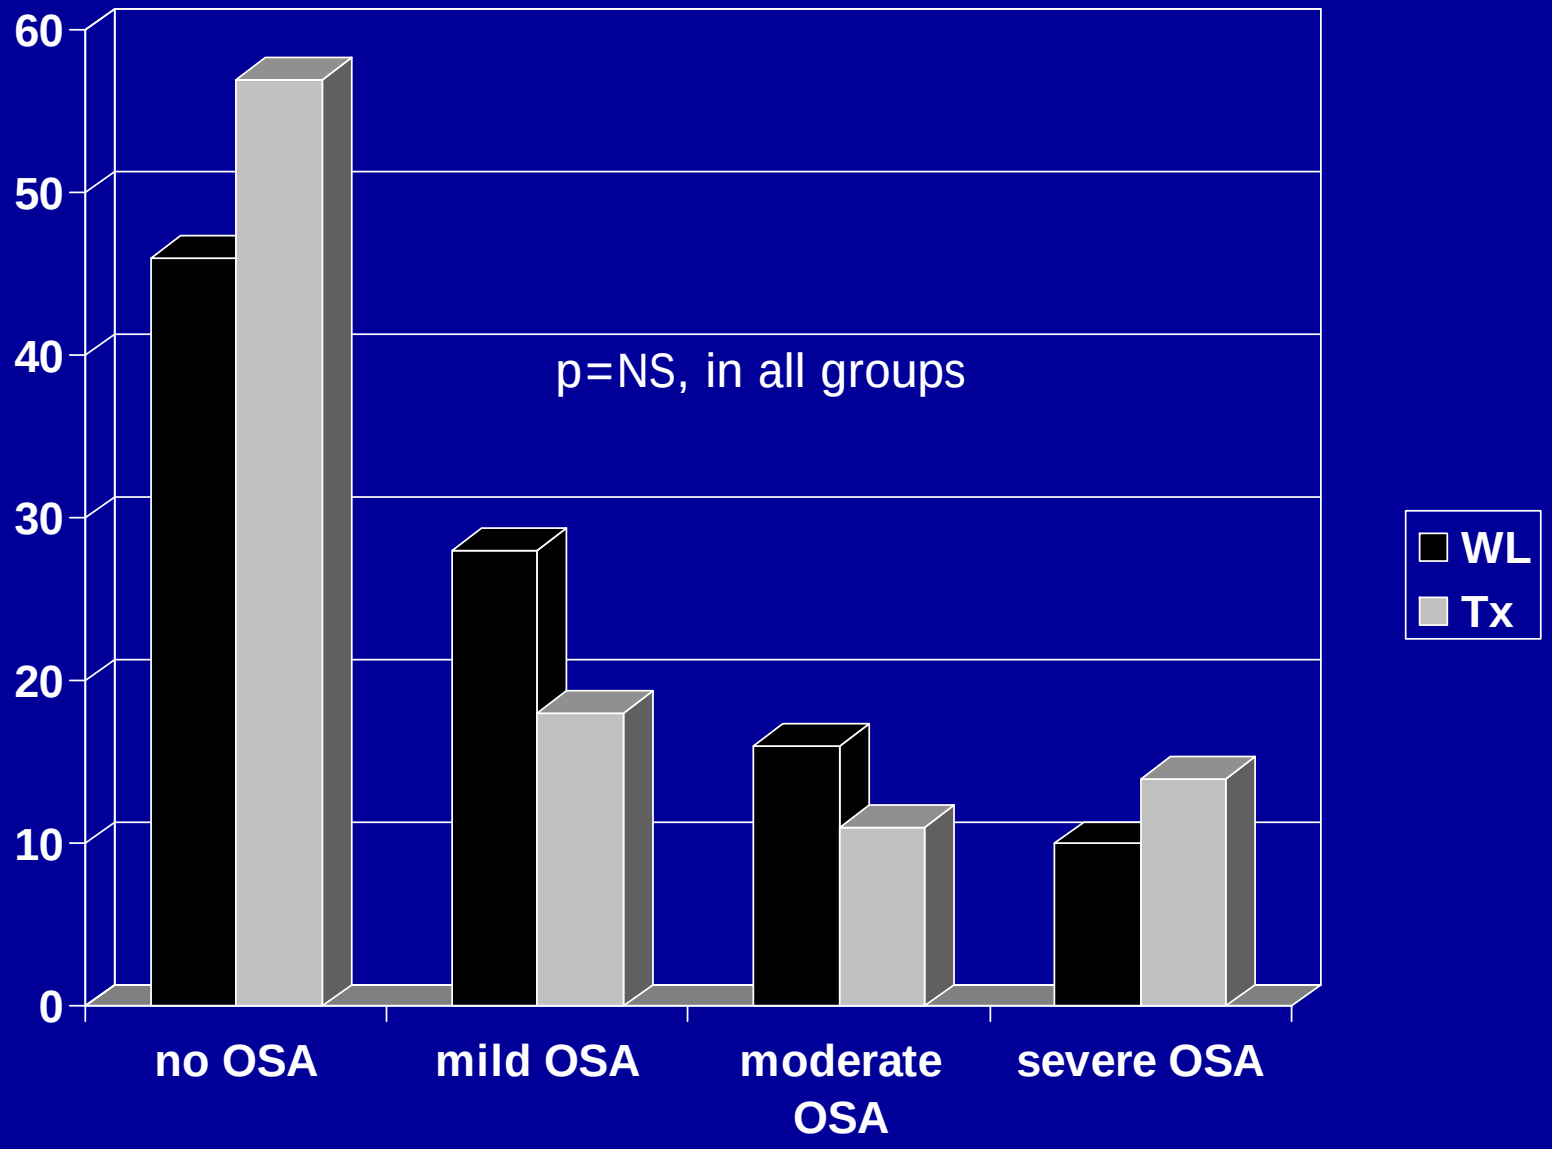
High prevalence of patients with a high risk for obstructive sleep apnoea syndrome after kidney transplantation—association with declining renal function

Miklos Zsolt Molnar[1,2,3], Andras Szentkiralyi[1], Anett Lindner[1], Maria Eszter Czira[1], Andras Szabo[4], Istvan Mucsi[1,2,5] and Marta Novak[1,6]

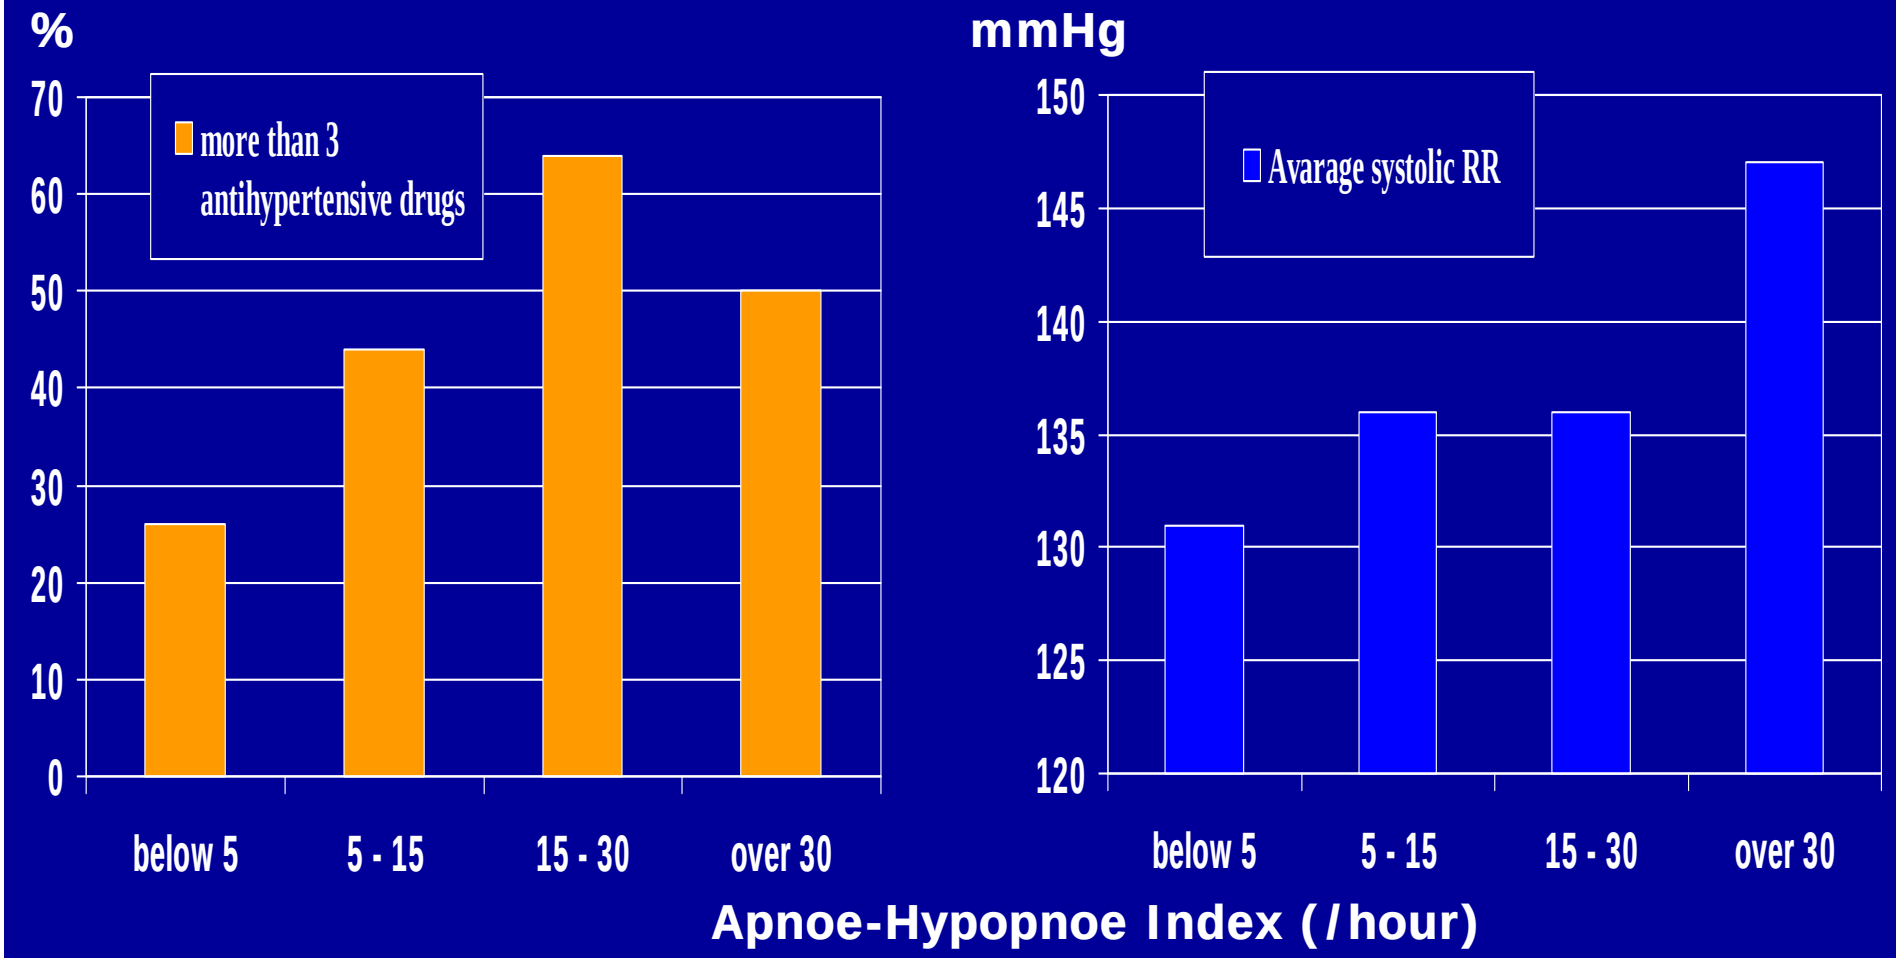


Nephrol Dial Transplant (2007)

Prevalence and severity of OSA

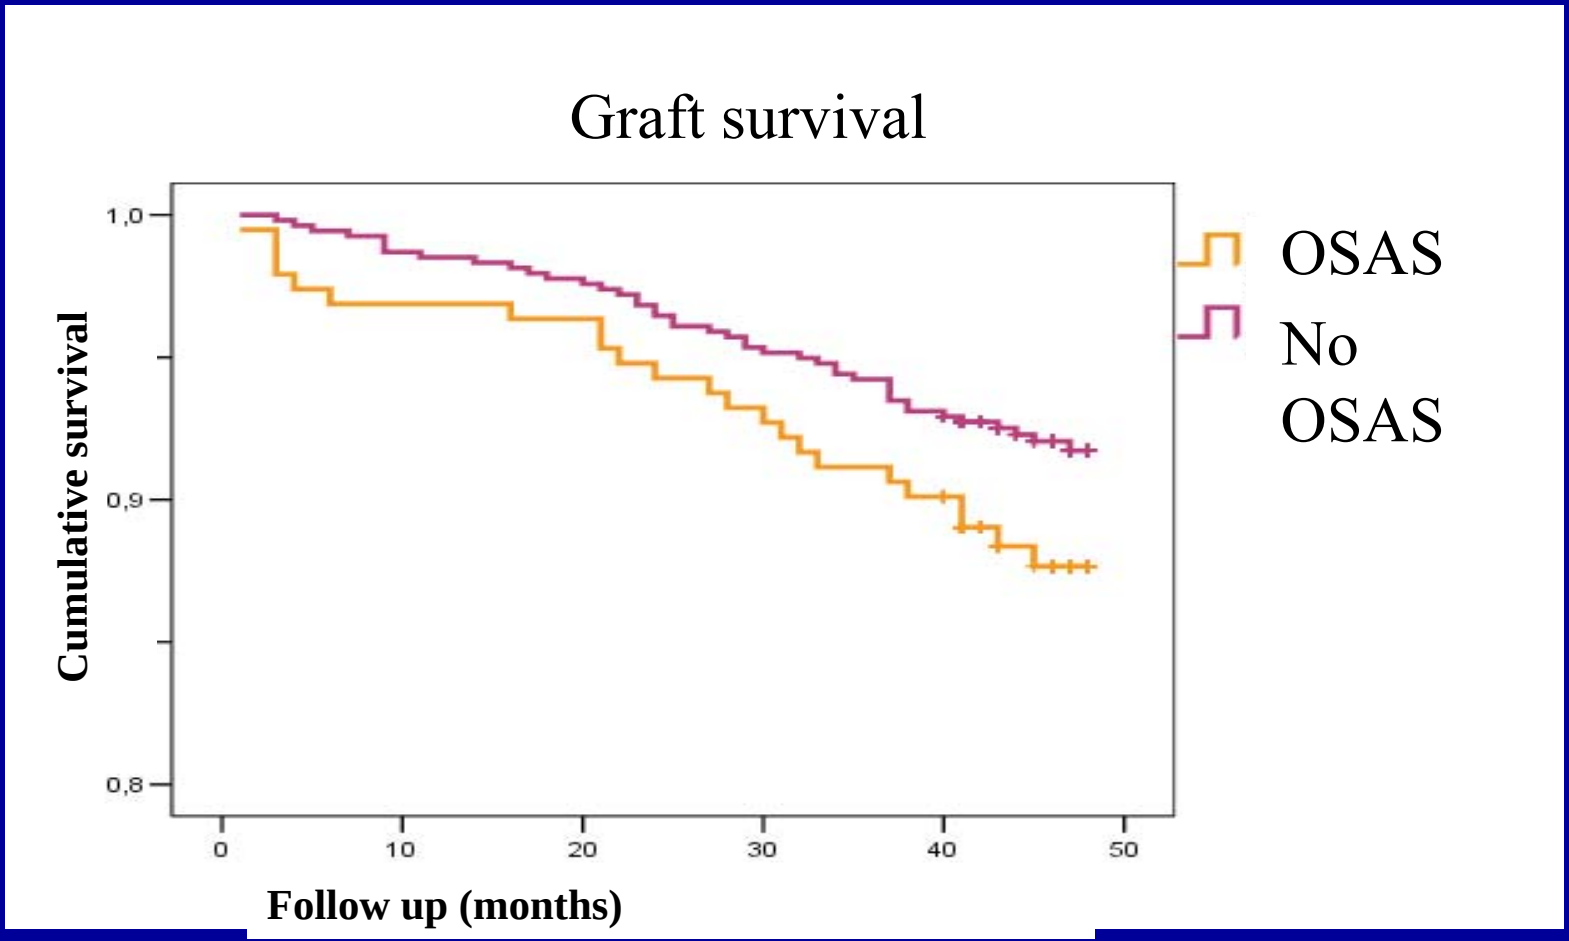


Severity of OSA vs hypertension in Tx



p<0.05; Linear-by-linear association, both

High risk of OSAS and graft failure



Sleep disorders in CKD patients - summary

- The prevalence of sleep disorders is much higher in patients with CKD than in the average population
- The prevalence of these conditions is the lowest in transplanted patients (except OSAS)
- Age, gender, renal function and co-morbidity is associated with sleep disorders in kidney transplanted patients

Sleep disorders in CKD patients - summary

- Patients with sleep disorders have more fatigue/daytime sleepiness, increased illness intrusiveness and impaired QoL
- OSAS is a predictor of graft loss, RLS is associated with mortality in transplanted patients

Conclusions

- Sleep disorders are underdiagnosed and un(der)treated in the CKD population
- Close collaboration between sleep specialists and nephrologists

may improve management of these treatable disorders and may improve QoL of renal patients
